Allowable Subject Matter

Claims 1-12 are allowed.

The following is an examiner's statement of reasons for allowance: None of the cited references teach or fairly suggest, in a communications system, a unit or method steps for holding plural bit-rate combination candidates in combination with a unit or method steps for applying error correction decoding processing as in applicants' claims 1-4, 9-12 or an error detecting means in combination with a data length determining means which determines a candidate for an initial data length for which an error could not be determined as in applicants' claims 5-8. It is noted that the units, means and method steps correspond to disclosed hardware items such as memories 63b, 63e, Viterbi decoder 63C, and voice codec 51 as well as receiver 61, demodulator 62, channel codecs 63 and 52 *etc.* thereby providing an invention having a useful, concrete and tangible result.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Lee *et al.* (20030126540) shows determining an error control protocol using error statistics, Reents *et al.* (6,978,412) discloses adjusting data rate based on errors, Habatu *et al.* (2006/0251176) teaches data length determination involving error detection (unit 408 in Fig. 14), Paiss (7,010,731) teaches a method and apparatus to generate a quality indicator by measuring an error in coded mode bits of a received frame is provided where the quality indicator may be indicative of modes of a codec and Nakao (JP 2001177466 A, cited by applicant) discloses, in a CDMA communication system, determination which of plural channels is received, each channel having different error correction encoding.
